# Introduction

With Apica LoadTest Portal you can create/upload your own (HTTP/S) load test scripts, execute them, store them in the repository, and finally compare results and generate reports. Also, select different geographic test clusters to run your test to compare regional performance.

Everything is accessible through a typical browser, so it's not necessary to download or use any local software.

The LoadTest Portal provides everything necessary for you to create, test, and analyze the capacity and performance of your web and cloud applications.

## Overview

### Log In

Apica LoadTest is accessed through a web-based control panel, using basic authentication.
